# NHS Hampshire, Southampton and Isle of Wight

## Guideline for the treatment of Dry Eye Syndrome in Primary Care

**Dry eye syndrome(DES)** is the final outcome of a number of conditions which affect the tear film which normally keeps the eye moist and lubricated. See <u>NICE CKS</u> for more details on assessment and management of DES.

DES is usually categorised into either aqueous or evaporative tear deficiency but clinically these often overlap and co-exist<sup>1</sup>

#### Aims of treatment

To relieve symptoms and improve the quality of life of patients with dry eye syndrome To restore, and prevent or minimize further structural damage to the ocular surface

#### **Potential causes**

**Medications** such as antihistamines, retinoids, topical ophthalmic medications (especially those containing preservatives, in particular, benzalkoniumchloride), oral contraceptives, beta-blockers, anticholinergics, and some psychotropics.

**Underlying systemic conditions** (e.g. systemic auto immune conditions, Sjogren's syndrome, diabetes mellitus, thyroid disease, and androgen deficiency)

Menopause

Contact lens use

**Dermatological disorders** such as rosacea, Steven Johnson's syndrome and mucous membrane pemphigus.

Meibomian gland dysfunction or blepharitis

Environmentalcauses such as low relative humidity, high wind velocity, and allergens.

#### Treatment options that may be used in secondary care

- Acetylcysteine eye drops or ointment
- ☐ Ciclosporin eye drops (Ikervis®)
- Punctal plugs
- Autologous serum eye drops
- Contact lens
- Oral pilocarpine
- Oral doxycycline

#### **Symptoms**

- Irritation or discomfort this may be described as burning, stinging or a 'gritty' sensation
- Dryness
- Intermittent blurring of vision
- Redness of the eyelids or conjunctiva
- Itching
- Photosensitivity
- Mucous discharge
- Ocular fatigue
- Symptoms may worsen as the day progresses

#### When to refer to Secondary Care?

- ☐ Significant pain/soreness on waking with recent history of injury
- Waking in the middle of the night with eye pain
- Unable to open eye after normal night's sleep
- Uncontrolled symptoms after 6 months
- Underlying systemic condition needing specialist management (e.g. Sjogren's syndrome)
- Use of preservative free products are required for over 4 weeks
- Deterioration of vision
- After unsuccessful treatment attempts with 3 products recommended in this guidance
- Suspected serious eye condition such as acute glaucoma, keratitis, iritis or corneal ulcer
- Abnormal lid anatomy or function

#### Management of dry eye syndrome in primary care:

Assessthe severity of dry eye by using the OSDI score (Ocular Surface Disease Index): OD Survey (squarespace.com)

If there are no red flags for a serious condition and the person does not need referral to secondary care:

#### Recommend lifestyle measures

Warm compresses, lid hygiene and massage—these can be especially helpful if blepharitis or Meibomian gland dysfunction are present.

Modification of contact lens wear: Contact lens wear should be limited to shorter periods and lenses removed when dry eye symptoms appear — changing lens type or solution may help.

#### **Environmental modification**— advise the person to:

Increase relative humidity and avoid prolonged periods of computer use or time in air-conditioned environments, if possible.

Lower computer screens to below eye level (decreasing lid aperture), take regular breaks, and increase blink frequency with computer use and reading. Avoid alcohol and exposure to cigarette smoke.

Optimise management of associated ocular or systemic conditions such as allergic conjunctivitis, blepharitis, rosacea, sleep apnoea <u>Blepharitis</u> (microquide.global)

If clinically appropriate, consideralternatives to medication that may exacerbate dry eye syndrome. These include antihistamines, retinoids, topical ophthalmic medications (especially those containing preservatives, in particular, benzalkoniumchloride–see below), oral contraceptives, beta–blockers, anticholinergics, and some psychotropics.

#### **Preservative toxicity:**

- Benzalkoniumchloride(BAK) is the most frequently used preservative in topical ophthalmic preparations, as well as in topical lubricants. The toxicity of BAK is related to its concentration, frequency of use, the level or amount of tear secretion, and the severity of the ocular surface disease. If patients have more than one eye condition for which they are usingeye drops, their potential exposureto preservatives is increased. In a patient with mild dry eye, preserved drops are often well tolerated when used four times a day or less
- There are newer types of preservatives known as "**soft or vanishing" or "oxidative "preservatives**. These degrade on exposure to UV light and oxygenin the tear film. Patients with severe dry eye due to reduced tear volume may not be able to degrade these fully, so they can still cause irritation
- Preservative-free formulations are necessary for the following indications:
  - $\,\circ\,$  Person is intolerant of preservative in tear supplements
  - Soft or hybrid contact lens wearers
  - $\circ\,$  Chronic eye disease who are multiple , preserved topical medication
  - o Has moderate to severe eye disease requiring drops more than 4 times/day

### NHS England over the counter items should not routinely be prescribed in primary care guidance<sup>4</sup>:

otc-guidance-for-ccgs.pdf(england.nhs.uk)

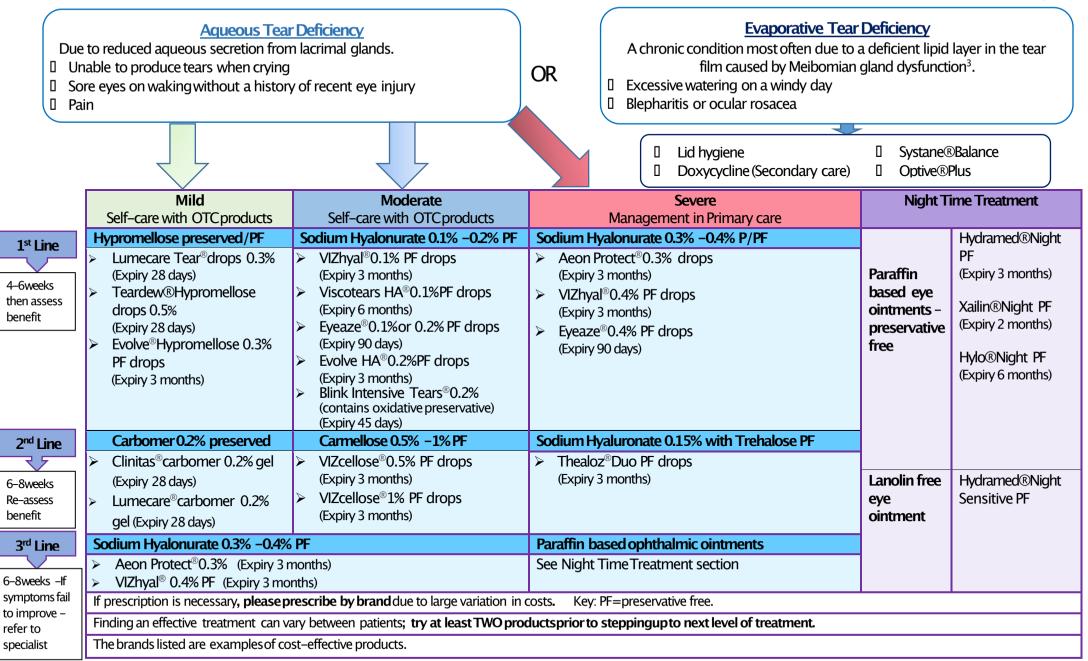

Please note that products may have a different brand name OTC versus the prescription product.

Patients can purchase over the counter products initially. Once patients have tried OTCproducts and self-help, and it has not improved their condition, or where they are deemed to have moderate to severe dry eye syndrome, or where it is a result of a chronic condition then it would then be reasonable for the GP to provide dry eye treatment on FP10.

Condition	Dry eyes/soretired eyes
	Dry eye syndrome or dry eye disease, is a commoncondition that occurs when the eyes do not make enough tears, or the tears evaporate too quickly. Most cases of sore tired eyes resolve themselves.
Advice to patients	Patients should be encouraged to manage both dry eyes and sore eyes by implementing some self care measures such as good eyelid hygiene and avoidance of environmental factors alongside treatment.
	Mild to moderate cases of dry eye syndrome or sore tired eyes can usually be treated using lubricant eye treatments that consist of a range of drops, gels and ointments that can be easily purchased over the counter
Exceptions	Pre-existing long-termconditions affecting the eyes.
Examples of medicines available to purchase OTC	Lubricant eye treatments include hypromellose 0.3% and carbomer  Brands include  Pharmacy own brands GelTears® Optrex ®range of eye drops Tears Naturale ®eye drops Viscotears ®Eyegel Blink®range of eye drops
OTCrestrictions	Pregnancy and breastfeeding
